

EventLens

Which positions are exposed?
What changes under an explicit stress?

Module B · Strategic Portfolio Stress Testing

Abhinav Jain

Vellore Institute of Technology, Bhopal

S&P Global × CRISIL × Naukri Campus

An analyst needs evidence behind the result.

INPUTS

Federal Reserve RSS/full releases
Official Federal Reserve Bluesky posts
Clearly labelled synthetic replay

ANALYST OUTPUT

Inspect the source and event interpretation.
Identify exposed positions.
Review an explained, conditional stress result.

Two live channels, one publisher.

They may repeat one announcement. They are not independent corroboration; source failures never switch to fictional evidence.

A fictional USD portfolio makes the demonstration reproducible without customer data.

One pipeline. Separate analysis and execution.

Sentiment is in $[-1, 1]$. It does not choose scenario direction. FinBERT is not the event classifier.

Impact 8 clears only the numeric threshold.

Synthetic input: "The Federal Reserve increased its policy rate by 50 basis points."

ILLUSTRATIVE IMPACT

1 + 4 magnitude + 3 scope
= 8

Automatic threshold: strictly > 7

Execution also checks

Asserted, supported event

Eligible evidence and publication freshness

Clear matching exposure

No blocking flags or failed refresh batch

Negation, speculation and same-event conflicts block automation.

Replay uses a simulation clock. User-pasted text remains unverified.

An impact-7 issuer default can only demonstrate the impact-8 shock through a labelled manual comparison.

A conditional stress, explained in dollars.

20 fictional positions · \$100m fair value · \$194.4m principal/notional, reported separately

LOAN L01 · IMPACT 8 / +100 BP STRESS

$$-\$6\text{m} \times 3.8 \times 100/10,000$$
$$= -\$228,000$$

Stressed value: \$5.772m

Portfolio P&L

Loans	−\$1.074m
Bonds	−\$1.564m
Swaps	+\$0.020m
Total	−\$2.618m

Stressed fair value: \$97.382m

50 bp announcement ≠ 100 bp stress assumption.

Cash uses duration; swaps use signed USD/bp. Each run starts from the original base. These are fictional what-if values, not forecasts of actual losses.

Engineering checks pass. Language limits remain.

183

Backend tests passed

30

Frontend tests passed

43

Browser checks passed

15-step isolated local clean install passed. Browser rerun did not recheck live providers.

12 archived Fed releases

Class/subtype 11/12

Assertion 9/12

Exact impact 4/12

Weaknesses to retain

Mixed clauses and dissenting alternatives

Target levels without prior-rate state

Sentence-local region matching

Archive: untuned for this rule version, one class/publisher, AI labels awaiting review.
Development 30/30 is tuning agreement. PhraseBank may overlap model training. Neither is independent accuracy.

A reviewable demonstrator, with explicit boundaries.

Available in the project

Source, MIT code license and Quickstart
API, dashboard and evidence exports
Fictional inputs, scenarios and saved runs

Before submission

Candidate walkthrough and label review
Model/data-use notices and repo naming
Published-clone check and 5–10 minute video

Next: independent publishers, human-reviewed unseen events, policy-state parsing.

Excluded: convexity, nonparallel curves, liquidity, FX, recovery/default cash flows and swap CVA.
No production-risk or investment-performance claim. New rules require new untouched test sources.
